Mantle metasomatism is a relatively recent concept introduced in the early s when detailed studies of lithospheric mantle rock fragments. The importance of mantle metasomatism has been widely acknowledged since there are hardly any investigations of either mantle xenoliths or. The idea of "mantle metasomatism" was explicitly introduced by Bailey. (,) to explain certain features of the highly alkaline magmatism associated with. Thus alkaline magmatism provides the best prima facie evidence of metasomatism and open-system conditions in the upper mantle. The list of added lithophile. Abstract. Mineral and whole-rock chemical data for peridotite xenoliths in basaltic lavas on Spitsbergen are examined to reassess mechanisms of melt–fluid inte. ?Abstract - ?INTRODUCTION - ?GEOLOGICAL SETTING - ?PETROGRAPHY AND. Mechanisms of Mantle Metasomatism: Geochemical. Evidence from the Lherz Orogenic Peridotite by J. L. BODINIER¹, G. VASSEUR¹, J. VERNIERES¹. Book summary: The concept of metasomatism and its role in the geochemical enrichment and depletion processes in upper mantle rocks remains contentious. Mantle metasomatism is a relatively recent concept introduced in the early s when detailed studies of lithospheric mantle rock fragments (xenoliths). Metasomatism is the chemical alteration of a rock by hydrothermal and other fluids. It is the Metasomatism is more complicated in the Earth's mantle, because the composition of peridotite at high temperatures can be changed by infiltration of. Mantle fragments carried up from as deep as km by high-velocity eruptions show metasomatic introduction of volatile bearing minerals. Abstract. Refractory rocks with light REE/heavy REE ratios greater than chondrite are common as xenoliths in basalts and kimberlites and are. Mantle metasomatism and rapid ascent of slab components beneath island arcs: Evidence from U?Th?Ra disequilibria of. Debate about the scale of mantle metasomatism has been ongoing for two decades. Early speculative hypoth- eses identified cryptic mantle metasomatism as a. The melts are represented by dykes of pyroxenites, hydrous minerals and gabbro that were emplaced in mantle peridotites of various origins. Not everyone in this business is convinced that metasomatism occurs in the mantle, some would argue that tenuous fluids cannot exist under such conditions . Mantle Metasomatism. Research output: Book/Report > Carbonated mantle domains at the base of the Earth's transition zone. Sun, W., Hawkesworth, C. J. Oceanic slab melting and mantle metasomatism. Scaillet B(1), Prouteau G. Author information: (1) Institut des Sciences de la Terre d'Orleans (ISTO), 1a Rue de. Mechanisms and Sources of Mantle Metasomatism: Major and Trace Element Compositions of Peridotite Xenoliths from Spitsbergen in the Context of Numerical. Cr-rich magnesiokatophorite as an indicator of mantle metasomatism by and clinopyroxene are commonly observed in hydrous mantle xenoliths hosted by. Hydrous Na-garnet was likely formed by metasomatic reactions between Cr-rich pyrope and Na-rich aqueous fluid in the deep upper mantle. The most likely.
